## Advanced Data Management for Data Science

### LECTURE 10 EXERCISES

### RELATIONAL DATABASE DESIGN: NORMALIZATION

# EXERCISE 1

Given:  $R(A, B, C, D, E)$                        $F = \{A \rightarrow BC\}$

Decomposition:  $R_1(A, B, C)$  and  $R_2(A, D, E)$

a) Is the decomposition lossless? Why?                      (iff  $R_1 \cap R_2 \rightarrow R_1$  or  $R_1 \cap R_2 \rightarrow R_2$ )

**Yes** The common attribute A is a key for  $R_1$ .

b) Is the decomposition dependency preserving? Why?                      (iff  $(\cup F_i)^+ = F^+$ )

**Yes**  $A \rightarrow BC$  is preserved in  $R_1$ .

c) Is the decomposition  $R_1(A, B, C)$  and  $R_2(C, D, E)$  lossless? Why?

**No** C is not a key for any table.

## EXERCISE 2

Given:  $R(A, B, C, D, E)$        $F = \{A \rightarrow BC, CD \rightarrow E, B \rightarrow D, E \rightarrow A\}$

Decomposition:  $R_1(A, B, C)$  and  $R_2(A, D, E)$

a) Is the decomposition lossless?      (iff  $R_1 \cap R_2 \rightarrow R_1$  or  $R_1 \cap R_2 \rightarrow R_2$ )

**Yes** The common attribute A is a key for  $R_1$ .

b) Is the decomposition dependency preserving?      (iff  $(\cup F_i)^+ = F^+$ )

**No** We lose  $CD \rightarrow E$  and  $B \rightarrow D$ .

## EXERCISE 3

### 2NF

R is in 2NF *if and only if*

For each FD:  $X \rightarrow A$  in  $F^+$ :

$A \in X$  (trivial FD) **or**

$X$  is **not** a proper subset of  
a candidate key for R **or**

$A$  is a **prime attribute** for R.

a) Given:  $R(A, B, C, D)$   $F = \{AB \rightarrow CD, B \rightarrow C\}$

Is R in 2NF? Why?

Key: AB  $AB^+ = \{A, B, C, D\}$   $B^+ = \{B, C\}$

**No** For  $B \rightarrow C$ , B *is* a proper subset of the key AB and C is non-prime.  
So, R is not in 2NF.

b) Given:  $R(A, B, C, D)$   $F = \{AB \rightarrow CD, C \rightarrow D\}$

Is R in 2NF? Why?

Key: AB  $AB^+ = \{A, B, C, D\}$   $C^+ = \{C, D\}$

**Yes** For  $C \rightarrow D$ , C is not a proper subset of the key, so R is in 2NF.

# EXERCISE 4

Identify the candidate key(s) and the current highest normal form for each of the following relation schemas given their corresponding FDs.

a)  $R(A, B, C, D, E)$

$$F = \{A \rightarrow B, C \rightarrow D\} = F^+$$

$$A^+ = \{A, B\}$$

$$C^+ = \{C, D\}$$

Candidate keys: ACE

⇒ For  $A \rightarrow B$  and  $C \rightarrow D$

- i. A and C are proper subsets of the candidate key ACE (both FDs fail 1<sup>st</sup> 2NF test).
- ii. both B and D are not prime attributes of R (both FDs fail 2<sup>nd</sup> 2NF test).

☞ Both FDs violate 2NF.

Normal form: 1NF

## 2NF

R is in 2NF *if and only if*

For each FD:  $X \rightarrow A$  in  $F^+$ :

$A \in X$  (trivial FD) **or**

$X$  is **not** a proper subset of a candidate key for R **or**

$A$  is a prime attribute for R.

## 3NF

R is in 3NF *if and only if*

For each FD:  $X \rightarrow A$  in  $F^+$ :

$A \in X$  (trivial FD) **or**

$X$  is a superkey for R **or**

$A$  is a prime attribute for R.

## EXERCISE 4 (cont'd)

Identify the candidate key(s) and the current highest normal form for each of the following relation schemas given their corresponding FDs.

b)  $R(A, B, C)$                        $F = \{AB \rightarrow C, C \rightarrow B\} = F^+$

$AB^+ = \{A, B, C\}$                        $C^+ = \{C, B\}$

**Candidate keys:** AB, AC

$\Rightarrow$  For  $AB \rightarrow C$ ,  
C is a prime attribute of R  
(FD passes 2<sup>nd</sup> 2NF and 3NF tests).

$\Rightarrow$  For  $C \rightarrow B$ ,  
B is a prime attribute of R  
(FD passes 2<sup>nd</sup> 2NF and 3NF tests).

$\Rightarrow$  Both FDs satisfy 3NF.

**Normal form: 3NF**

### **2NF**

R is in 2NF *if and only if*  
For each FD:  $X \rightarrow A$  in  $F^+$ :  
A  $\in X$  (trivial FD) **or**  
X is **not** a proper subset of  
a candidate key for R **or**  
A is a **prime attribute** for R.

### **3NF**

R is in 3NF *if and only if*  
For each FD:  $X \rightarrow A$  in  $F^+$ :  
A  $\in X$  (trivial FD) **or**  
X is a **superkey** for R **or**  
A is a **prime attribute** for R.

## EXERCISE 4 (cont'd)

Identify the candidate key(s) and the current highest normal form for each of the following relation schemas given their corresponding FDs.

c)  $R(A, B, C, F)$                        $F = \{AB \rightarrow C, C \rightarrow F\} = F^+$

$AB^+ = \{A, B, C, F\}$                        $C^+ = \{C, F\}$

**Candidate keys:** AB

⇒ For  $AB \rightarrow C$

- i. AB is not a proper subset of a candidate key (FD passes 1<sup>st</sup> 2NF test);
- ii. AB is a superkey for R (FD passes 1<sup>st</sup> 3NF test).

⇒ For  $C \rightarrow F$

- i. C is not a proper subset of a candidate key (FD passes 1<sup>st</sup> 2NF test);
- ii. C is not a superkey of R (FD fails 1<sup>st</sup> 3NF test);
- iii. F is not a prime attribute (FD fails 2<sup>nd</sup> 3NF test).

☞ Both FDs satisfy 2NF.

### 2NF

R is in 2NF *if and only if*  
For each FD:  $X \rightarrow A$  in  $F^+$ :  
 $A \in X$  (trivial FD) **or**  
 $X$  is **not** a proper subset of  
a candidate key for R **or**  
 $A$  is a **prime attribute** for R.

### 3NF

R is in 3NF *if and only if*  
For each FD:  $X \rightarrow A$  in  $F^+$ :  
 $A \in X$  (trivial FD) **or**  
 $X$  is a **superkey** for R **or**  
 $A$  is a **prime attribute** for R.

**Normal form: 2NF**

# EXERCISES

**Exercise 5:** Decompose  $R(A, B, C, D, E, F, G)$  into 3NF relations for the FD set  $F = \{AB \rightarrow CD, C \rightarrow EF, G \rightarrow A, G \rightarrow F, CE \rightarrow F\}$ .

**Exercise 6:** Decompose  $R(A, B, C, D)$  into 3NF and BCNF relations for each of the following FD sets.

a)  $F = \{B \rightarrow C, D \rightarrow A\}$       b)  $F = \{ABC \rightarrow D, D \rightarrow A\}$

**Exercise 7:** Given:  $\text{Sale}(\text{customer}, \text{store}, \text{product}, \text{price})$  and the constraints:  
A customer buys from only one store.

There is a unique price for each product in a store, but the same product can have a different price in different stores.

a) What are the FDs implied by the above description?

b) What are the candidate keys?

c) Explain why  $\text{Sale}$  is not in 3NF.

d) Decompose  $\text{Sale}$  into 3NF relation schemas.

e) Is the decomposition dependency preserving? Why?

## EXERCISE 5

Decompose  $R(A, B, C, D, E, F, G)$  into 3NF relations for the FD set  $F = \{AB \rightarrow CD, C \rightarrow EF, G \rightarrow A, G \rightarrow F, CE \rightarrow F\}$ .

### Attribute closures

$$AB^+ = \{A, B, C, D, E, F\} \quad C^+ = \{C, E, F\} \quad G^+ = \{G, A, F\} \quad CE^+ = \{C, E, F\}$$

**Candidate key:** BG      From  $G \rightarrow A$  we can infer  $BG \rightarrow AB$  using **IR2**.

$$BG^+ = \{B, G, A, C, D, E, F\} \quad \text{All FDs violate 3NF!}$$

**Canonical cover:**  $F_C = \{AB \rightarrow CD, C \rightarrow EF, G \rightarrow AF\}$

**3NF decomposition:**  $R_1(\underline{A}, \underline{B}, C, D)$        $R_3(\underline{G}, A, F)$   
 $R_2(\underline{C}, E, F)$        $R_4(\underline{B}, \underline{G}) \Rightarrow$  due to the candidate key

## EXERCISE 6

Decompose  $R(A, B, C, D)$  into 3NF and BCNF relations for each of the following FD sets.

a)  $F = \{B \rightarrow C, D \rightarrow A\}$

Attribute closures:  $B^+ = \{B, C\}$      $D^+ = \{D, A\}$

Candidate keys: BD

Canonical cover:  $F_C = \{B \rightarrow C, D \rightarrow A\}$

### 3NF Decomposition

$R_1(\underline{B}, C)$

$R_2(\underline{D}, A)$

$R_3(\underline{B, D}) \Rightarrow$  due to the candidate key

### BCNF Decomposition

$R_1(\underline{B}, C)$

$R_2(\underline{D}, A)$

$R_3(\underline{B, D})$

## EXERCISE 6 (cont'd)

Decompose  $R(A, B, C, D)$  into 3NF and BCNF relations for each of the following FD sets.

b)  $F = \{ABC \rightarrow D, D \rightarrow A\}$

Attribute closures:  $ABC^+ = \{A, B, C, D\}$        $D^+ = \{D, A\}$

Candidate keys:  $ABC, BCD$       **Using IR2:  $BCD \rightarrow ABC$**

Canonical cover:  $F_C = \{ABC \rightarrow D, D \rightarrow A\}$

### 3NF Decomposition

Already in 3NF

$R(\underline{A}, \underline{B}, \underline{C}, D)$

Dependency preserving?

**Yes**

Is this BCNF decomposition OK?

$R_1(\underline{A}, \underline{B}, \underline{C})$  and  $R_2(\underline{D}, A)$  **No Why?**

### BCNF Decomposition

Only  $D \rightarrow A$  violates BCNF

$R_1(\underline{B}, \underline{C}, \underline{D})$        $R_2(\underline{D}, A)$

Dependency preserving?

**No** The FD  $ABC \rightarrow D$  is lost.

The FD  $ABC \rightarrow D$  is lost, and we need to join  $R_1$  and  $R_2$  on  $A$ , but  $A$  is not a key of  $R_2$ .  
 $\Rightarrow$  **Not a lossless decomposition!**

# EXERCISE 7

Given: Sale(customer, store, product, price) and the constraints:

A customer buys from only one store.

There is a unique price for each product in a store, but the same product can have a different price in different stores.

a) What are the FDs implied by the above description?

customer  $\rightarrow$  store

store, product  $\rightarrow$  price

b) What are the candidate keys?

{customer, product}

Since customer, product  $\rightarrow$  store, product (**IR2**)

and customer, product  $\rightarrow$  price (**IR3**)

Also {customer, product}<sup>+</sup> = {customer, product, store, price}

## EXERCISE 7 (cont'd)

### 3NF

R is in 3NF *if and only if*

For each FD:  $X \rightarrow A$  in  $F^+$ :

$A \in X$  (trivial FD) **or**

$X$  is a **superkey** for R **or**

$A$  is a **prime attribute** for R.

Given: Sale(customer, store, product, price)

A customer buys from only one store.

There is a unique price for each product in a store, but the same product can have a different price in different stores.

c) Explain why Sale is not in 3NF. candidate key: {customer, product}

Both FDs violate 3NF.  $F = \{\text{customer} \rightarrow \text{store}; \text{store, product} \rightarrow \text{price}\}$

The LHS of the FDs are not superkeys; the RHS are not prime attributes of Sale.

d) Decompose Sale into 3NF relation schemas.

$R_1(\underline{\text{customer}}, \text{store})$

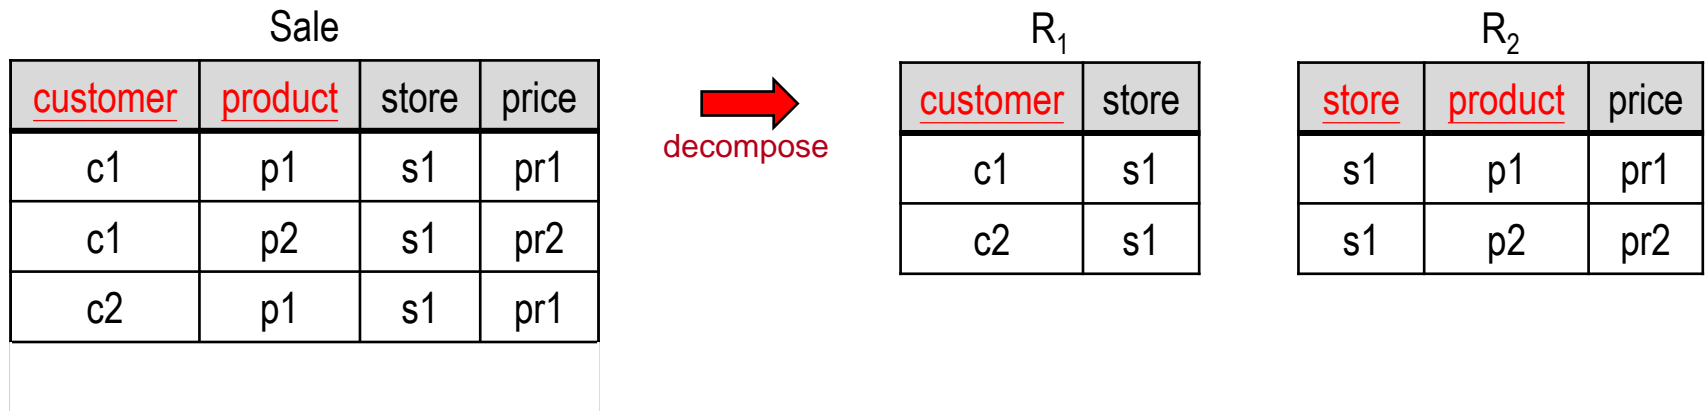

$R_2(\underline{\text{store, product}}, \text{price})$

e) Is the decomposition dependency preserving? Why?

**Yes** Each FD is preserved in a relation schema, **BUT** ... (next page).

## EXERCISE 7 (cont'd)

The decomposition  $R_1(\underline{\text{customer}}, \text{store})$ ,  $R_2(\underline{\text{store}}, \underline{\text{product}}, \text{price})$  is **lossy** because the common attribute **store** is not a key of any table.

The two decomposed relations do not generate the original one if joined (on the common **store** attribute). The **join result contains 4 records instead of 3** as in the original relation.

**What is the problem?** None of the fragments contains the candidate key (**customer**, **product**).

**Solution?** Include an additional table  $R_3(\text{customer}, \text{product})$  containing the candidate key in the decomposition.

$R_3$

<u>customer</u>	<u>product</u>
